

Precautions : please follow these instructions while showing the project-

- Game : move the telescope a little bit as soon as it loads. Otherwise might cause minor graphics related issues. Use key - W,S,A,D or Up , down , left , right for PC .
- Use the PC version if possible . It shows better graphics and better performance and I tested it , it works just fine. I couldn't test the Android version .
- For "From James Webb" Telescope option use value between 2 . It is the most ideal . Other will work but it is most ideal.
- For "Orbital Simulation" Telescope use 1/2 . Other will work but 2 is ideal.
- For "Orbital Simulation" Solar system you can use anything . The faster the better . I'd recommend between 2/3/4/5. 5 is most ideal.
- Don't open trivial it is empty.
- When you'd open the game there will be a menu called "NASA Project Configuration". There will be an option called "windowed" . Mark this box then you can choose any screen resolution . The higher the better.
